

ABSTRACT OF THE DISCLOSURE

The present invention provides methods of selectively inducing terminal
5 differentiation, cell growth arrest and/or apoptosis of neoplastic cells, and/or inhibiting
histone deacetylase (HDAC) by administration of pharmaceutical compositions
comprising potent HDAC inhibitors. The oral bioavailability of the active compounds in
the pharmaceutical compositions of the present invention is surprisingly high. Moreover,
the pharmaceutical compositions unexpectedly give rise to high, therapeutically effective
10 blood levels of the active compounds over an extended period of time. The present
invention further provides a safe, daily dosing regimen of these pharmaceutical
compositions, which is easy to follow, and which results in a therapeutically effective
amount of the HDAC inhibitors *in vivo*. The present invention also provides a novel Form
I polymorph of SAHA, characterized by a unique X-ray diffraction pattern and
15 Differential Scanning Calorimetry profile, as well a unique crystalline structure.
